ACKNOWLEDGMENT

I would like to express my gratitude to Allah S.W.T for giving me the opportunity to complete this project.

I also wish to express my appreciation to all those who had been willing to support me throughout the progress of this project. I would like to express my gratitude to my supervisor, Ir. Surya Hardi for all the advices and guides given towards the successful completion of this project.

Also not to forget, my utmost thanks to my family, friends and each of those, whom without them, this project would not be probably at its form.

May God bless you all until the end of time. Wassalam and thank you.

APPROVAL AND DECLARATION SHEET

This project report titled Tunneling Characteristic of Voltage Sag in Power System was prepared and submitted by Mohd Faizal bin Amril (Matrix Number: 081090459) and has been found satisfactory in terms of scope, quality and presentation as partial fulfillment of the requirement for the Bachelor of Engineering (Electrical System) in Universiti Malaysia Perlis (UniMAP).

Checked and Approved by

**(IR. SURYA HARDI AMRIN)
Project Supervisor**

**School of Microelectronic Engineering
Universiti Malaysia Perlis**

MAY 2011

DECLARATION SHEET

I hereby declare that my Final Year Project Thesis is the result of my research work under supervision of Ir. Surya Hardi Amrin. All literature sources used for the writing of this thesis have been adequately referenced.

Name : MOHD FAIZAL BIN AMRIL
Candidate number : 081090459
Supervisor : IR. SURYA HARDI AMRIN
**Title of thesis : CHARACTERISTICS OF VOLTAGE SAGS IN
POWER SYSTEMS**

CIRI-CIRI VOLTAN LENDUT PADA SISTEM KUASA

ABSTRAK

Kejatuhan voltan diklasifikasikan sebagai voltan purata punca kuasa dua yang berlaku dalam masa yang singkat ketika gangguan elektrik yang menyebabkan peralatan pengguna dan beban pada bekalan kuasa tidak berfungsi sepenuhnya dan juga dikenali sebagai faktor utama masalah gangguan bekalan kuasa. Walaubagaimanapun, tesis ini menyelidiki gangguan yang berlaku yang disebabkan oleh litar pintas atau kerosakan pada talian penghantaran tiga fasa. Tesis ini juga membandingkan perbezaan kejatuhan voltan pada setiap terminal Bas untuk sistem tiga fasa dimana perbezaan kejatuhan voltan adalah disebabkan oleh pengaruh sambungan pengubah dan juga disebabkan jenis kerosakan yang berlaku. Simulasi telah dijalankan menggunakan perisian PSCAD dimana ia berdasarkan pada beberapa tatarajah yang telah di modelkan. Sistem yang digunakan dalam tesis ini adalah sistem talian penghantaran dua Bas. Keputusan simulasi menunjukkan talian tiga fasa mengalami kejatuhan voltan yang rendah pada terminal Bas yang ke dua dibandingkan dengan terminal Bas yang pertama disebabkan oleh litar pintas dua fasa ke bumi. Ini adalah bergantung pada keadaan pengubah yang digunakan pada litar samada pengubah penaik atau pengubah penurunan. Litar pintas atau kerosakan yang berlaku pada terminal Bas ke dua menyebabkan berlaku penurunan voltan yang dalam pada terminal motor aruhan dan kenaikan arus pada terminal motor tersebut.

CHARACTERISTICS OF VOLTAGE SAGS IN POWER SYSTEMS

ABSTRACT

Voltage sags are the short durations in root-mean-square (RMS) rated AC voltage occur during faults may cause miss-operations to the customer's equipment and loads of power system and recognized as the most important power quality problem. However, this thesis investigates the sag event which is caused by a short circuit or fault to the three-phase transmission line. This thesis also presents the comparisons between voltage reductions at two Bus terminals for three-phase systems where the difference in voltage drop or reduction is caused by the transformer connection and also because of the type of fault caused. Simulations were carried out using PSCAD software which it is based on a number of configurations which has been modeled. The systems used in this thesis are two Bus transmission line systems. Simulation results indicate that three-phase line has a low voltage reduction at second bus terminal compared with the first Bus terminal due to the two-phase to ground fault. This is dependent on the transformer used in the circuit either step-up or step-down transformer. Short circuit or fault occurring on the second Bus terminal causing of the voltage decreased in the terminal of induction motor and increased induction motor current at the motor terminal.

CHAPTER 1 INTROUCTION	
1.0 Power Quality	1
1.1 Power Quality Disturbance	2
1.2 Objective	3
1.3 Problem Statement	4
1.4 Scope of the project	5
1.5 Report Outline	6
CHAPTER 2 LITERATURE REVIEW	
2.0 Introduction	8
2.1 Definition Voltage Sag	9
2.2 Factors Affecting Sag Characteristics	10
2.3 Origin of Voltage Sags	12
2.4 The Influence of Transformer Winding Connections on Voltage sag	14

2.5	Induction Motor	16
2.5.1	Electrical and Mechanical Circuits Of Induction Motors	17
2.5.2	Squirrel-cage induction motor models	19
2.5.3	Effect of Voltage Sags on Induction motor	21
2.5.3.1	De-acceleration of Induction Motor	22
2.5.3.2	Re-acceleration of Induction Motor	23

CHAPTER 3 METHODOLOGY

3.0	Introduction	24
3.1	PSCAD	26
3.2	Characteristics of Software	26
3.3	Example of Circuit	28
3.3.1	Modeling of Transformer	30
3.3.2	Modeling of induction motor	31

CHAPTER 4 RESULT

4.1	Introduction	33
4.2	Simulation result	33
4.2.1	Cases 1: Step-up transformer with delta-wye to ground connection using dynamic load	34
4.2.2	Cases 2: Step-down transformer with delta-wye to ground connection using combine load	37
4.2.3	Cases 3: Step-down transformer with delta-wye to ground connection using dynamic load with different length of transmission line	40
4.2.4	Cases 4: Two transformers with delta-wye to ground connection using dynamic load	45
4.2.5	Cases 5: Step down transformers with delta-wye to ground connection using two dynamic loads	48
4.3	Discussion	50

CHAPTER 5 CONCLUSION

5.2	Summary	52
5.3	Recommendation	53
