## ACKNOWLEDGEMENT

The writing of this dissertation has been one of the most significant academic challenges I have ever had to face. Without the support, patience and guidance of my supervisor, Pn Norlia Bt Mohamad Ibrahim, this study would not have been completed. I attribute the success of my undergraduate degree to her encouragement, wisdom and commitment to the highest standards. One simply could not wish for a better or friendlier supervisor.

I have been blessed with a friendly and cheerful friends Syamim Adila and Nizam Adhaa, who inspired and motivated me despite the enormous work pressures we were facing together. I am indebted to them for being a great companion who always there to lend a hand to me and clear my doubts on writing this thesis.

Finally, I am deeply grateful for the encouragement my family members shown to me throughout my studies at university. Their continuous support and profound understanding are the reasons that keep me going and provided me the determination to complete this dissertation.

## **APPROVAL AND DECLARATION SHEET**

**This project report titled Stability Study of High Rise IBS Building Using STAAD PRO was prepared and submitted by Engku Muhammad Afnan Bin Engku Azman (Matrix Number: 091200220) and has been found satisfactory in terms of scope, quality and presentation as partial fulfillment of the requirement for the Bachelor of Engineering (Building Engineering) in Universiti Malaysia Perlis (UniMAP).**

# **KAJIAN KESTABILAN BANGUNAN TINGGI IBS MENGGUNAKAN STAAD PRO**

## **ABSTRAK**

Kestabilan merupakan masalah asas dalam mekanik pepejal yang mesti dikuasai untuk memastikan keselamatan struktur daripada masalah keruntuhan. Teori kestabilan adalah amat penting bagi kejuruteraan struktur. Oleh itu kajian ini membentangkan tingkah laku dan kestabilan bangunan tinggi Sistem Binaan Berindustri (IBS). Perisian STAAD PRO telah digunakan untuk menganalisis keputusan output. Dua bangunan berbeza ketinggian dengan 40.0 m dan 150.0 m telah dibandingkan dari aspek momen lentur, nilai ricih, dan kelajuan angin yang berbeza. Penilaian struktur menunjukkan bahawa momen lentur di tingkat bawah bangunan adalah lebih besar daripada momen lentur di tingkat atas. Selain itu analisis terhadap daya ricih telah menunjukkan terdapat perbezaan kecil di setiap tingkat. Ini kerana setiap tingkat membawa beban hidup dan beban mati yang sama untuk menahan daya ricih. Peningkatan kelajuan angin meningkatkan nilai momen lentur struktur. Tambahan pula, kekuatan angin meningkat dengan ketinggian bangunan. Secara ringkas kajian ini membuktikan bahawa bangunan yang lebih rendah adalah lebih stabil daripada bangunan yang lebih tinggi kerana struktur telah membawa beban menegak dan beban angin sisi. Walau bagaimanapun, kajian perlu dipertingkatkan dengan meningkatkan saiz tiang secara beransur-ansur ke arah asas lantai untuk menahan beban sisi dan meningkatkan kestabilan bangunan.

## ABSTRACT

Stability presents a fundamental problem in solid mechanics which must be mastered to ensure the safety of structures against collapse. The theory of stability is crucial importance for structural engineering. Thus this study presents the behavior and stability of high rise building of Industrialised Building System (IBS). STAAD PRO software has been used to analyze the output of the results. Two different heights of building with 40.0 m and 150.0 m building are compared in term of bending moment, shear forces and different value of wind speed. The structural evaluation shows that bending moment at the lower floor of building are greater than the bending moment at the top floor. Besides, analysis had shown shear forces have slightly difference in every floor. This is due to each floor carry an equal live load and dead load to resist shearing forces. The increases of wind speed increase the value of bending moment of structure. Furthermore, the intensities of wind increase with height of the building. Shortly this study prove that lower building is more stable than the higher building because the structure has to carry more vertical loads and the lateral wind. However study has to be improved by increasing the column sizes progressively towards the base of the floor to resist lateral loads to increase the stability of building.

<b>EQUATION</b>	<b>xiv</b>
<b>LIST OF ABBREVIATIONS</b>	<b>xv</b>
<b>CHAPTER 1 INTRODUCTION</b>	
1.1 Overview	1
1.2 Background of Study	5
1.3 Problem Statements	6
1.4 Objectives	6
1.5 Scope of Study	7
1.6 Significant of Study	7

## **CHAPTER 2 LITERATURE REVIEW**

2.1	Introduction	8
2.2	Structures and Loads	9
2.2.1	Classification of Structures.	11
2.2.2	Loads	13
2.3	Tall Building Structural Design.	16
2.3.1	Subsystems and Components.	16
2.4	Developments of Tall Buildings in Structural Systems.	17
2.4.1	Premium of Height.	18
2.4.2	Classification of Tall Buildings Structural Systems.	20

## **CHAPTER 3 METHODOLOGY**

3.1	Analysis Parameters and Specifications	22
3.2	Modeling Mode	23
3.3	Generation of Member Property	24
3.4	Supports	25
3.5	Materials for the Structures	26
3.5.1	Material Constant	26
3.6	Loadings	28
3.6.1	Self-weight	28
3.6.2	Dead Load	28
3.6.3	Live Load	29
3.6.4	Wind Load	29
3.6.5	Load Combinations	29

3.7	Analyzing	29
	3.7.1 Post Processing	31
3.8	Summary	32

## **CHAPTER 4 RESULTS AND DISCUSSION**

4.1	Introduction	33
4.2	Effect on Bending Moment for a Selected Beam in x-direction of Two Different Height Building.	35
4.3	Effect on Bending Moment for a Selected Column in x-direction of Two Different Height Building.	36
4.4	Effect on Shear Forces for a Selected Beam in x-direction of Two Different Height Building.	38
	4.4.1 Shear Force in 8-storey Building.	38
	4.4.2 Shear Force in 30-storey Building.	39
4.5	Effect on Bending Moment for a Selected Beam in x-direction Due to Different Wind Speed.	40
4.6	Load and Stability	42
	4.6.1 Load Distribution	42
	4.6.2 Loading Assumptions ULS and SLS	47

## **CHAPTER 5 CONCLUSION**

5.1	Conclusion	49
5.2	Recommendations	50
5.3	Further Studies	51
5.4	Commercialization	51
