

**DEVELOPMENT OF A NOVEL INTELLIGENT  
WIRELESS SENSOR ACTOR NETWORK FOR  
AGRICULTURAL APPLICATIONS**

by

**Naseer Sabri Salim**

**(0940210430)**

A thesis submitted in fulfillment of the requirements for the degree of  
Doctor of Philosophy

**School of Computer and Communication Engineering  
UNIVERSITY MALAYSIA PERLIS**

2013

**UNIVERSITY MALAYSIA PERLIS**

**DECLARATION OF THESIS**

Author's Full Name : Naseer Sabri Salim  
Date of Birth : 16. Oct. 1969  
Title : DEVELOPMENT OF A NOVEL INTELLIGENT WIRELESS SENSOR  
ACTOR NETWORK FOR AGRICULTURAL APPLICATIONS  
Academic Session : 2010/2011

I, hereby declare that this thesis becomes the property of University Malaysia Perlis (UniMAP) and to be placed at the university library. This thesis is classified as:

- CONFIDENTIAL (contains confidential information under the Official Secret Act 1972)\*
- RESTRICTED (Contains restricted information as specified by the organization where research was done)
- OPEN ACCESS I agree that my thesis is to be made immediately available as hard copy or on-line open access (full text)

I, the author, give permission to University Malaysia Perlis to reproduce this thesis in whole or in part of the purpose of research or academic exchange only (except during a period of ..... years, if so requested above)

## ACKNOWLEDGMENTS

*“It is not possible to prepare anything without the assistance of Allah (SWT); my welfare is only in Allah”*

Firstly and foremost, special thanks should be given to **Allah**, the most gracious, the most merciful, who guides me in every step I take. On the very outset of this report, I would like to extend my sincere and heartfelt obligation to all the people who have helped me in this endeavour. Without their active guidance, help, cooperation and encouragement, I would not have made headway in this research.

I am ineffably indebted to my supervisor, **Prof. Dr. Syed Alwee Aljunid**, for his conscientious guidance and encouragement to accomplish this assignment. I extend my gratitude to **University Malaysia Perlis** for giving me this opportunity. I am extremely thankful to co-supervision of **Prof. Dr. R.A. Badlishah, Prof. Ir. Dr. R. Kamaruddin** and **Dr. M.F. Malek** for their valuable support in the completion of this research. I am also grateful to **Eng. Hisham** and the UniMAP greenhouse campus for their advice and assistance.

I also acknowledge with a deep sense of reverence, **my family**, who have always supported me morally. I have extreme gratitude for my brother and his family, for their support and patience.

Last but not least, gratitude goes to all of my friends who directly or indirectly helped me to complete this project. Any omission in this brief acknowledgement should not be taken as a lack of gratitude.

**Thank You**

**Naseer Sabri Salim**

**1 June 2013**

*To whom I belong,*

*To the Spirit of the Martyr*

*Dr. Safaa Sabri Salim*

<b>CHAPTER ONE TOWARD INTELLIGENT WIRELESS SENSOR ACTOR NETWORKS</b>	
1.1 Introduction	1
1.1.1 Modern Technology in Agricultural Field	2
1.1.2 Intelligent Control System and WSAN	3
1.2 Problem Statement	4
1.3 Objectives of the Research	5
1.3.1 To Develop of a Novel Intelligent WSAN Based on FIS	5
1.3.2 To Implement of Vegetation Path Loss Model for WSN Simulators	6
1.4 Methodology	6
1.4.1 Intelligent Controller Design and Simulation	8
1.4.2 Wireless Sensor Actor Network	9
1.5 Outline of The Research	10

## **CHAPTER TWO LITERATURE REVIEWS**

2.1 Introduction	12
2.2 Literature Reviews of WSAN in Agriculture Greenhouse	14
2.3 Literature Reviews of Intelligent Control in Agriculture Greenhouse	21
2.4 Agricultural WSAN Challenges	27
2.5 WSAN Concepts and Specificities	29
2.6 WSAN Standard	32
2.6.1 IEEE 802.15.4 and ZigBee Standard	34
2.7 Conclusion	38

## **CHAPTER THREE DESIGN AND SIMULATION OF A GREENHOUSE CLIMATE FUZZY LOGIC CONTROLLER**

3.1 Introduction	40
3.2 Temperature and Humidity FLC Design	41
3.2.1 Linguistic Input And Output Variables	43
3.2.2 Fuzzy Controller Rules	43
3.2.3 Fuzzy Membership Functions and Inference Method	45
3.3 Fuzzy Logic Controller Based on RSS Method	49
3.4 FLC Design Summary	53
3.5 Greenhouse Climate Energy Balance Modelling	55
3.5.1 Greenhouse Heating Requirements	56
3.5.2 Greenhouse fan requirements	57
3.5.3 Evaporative cooling system	59
3.6 Basic Concepts of Greenhouse Climate FLC Simulator	60
3.7 Simulation of Greenhouse Intelligent Control System	65
3.7.1 Steady State Response	67

3.7.2 Step Function Response	75
3.8 Summary	83
<b>CHAPTER FOUR DEVELOPMENT OF INTELLIGENT WSAN BASED ON FUZZY INFERENCE SYSTEM</b>	
4.1 Introduction	85
4.2 Agricultural Greenhouse WSAN Technology	88
4.2.1 Wireless Network Nodes Software	89
4.2.2 Network Nodes Deployment	91
4.3 Intelligent WSAN Based on FIS	94
4.4 Design Factors of IWSAN Based on Greenhouse	97
4.5 System Design of IWSAN-GH	98
4.5.1 Greenhouse coordinator sensor node (MGHSN)	100
4.5.2 Sensor and Actuator Circuitry Node	104
4.5.3. Light Dependent Resistance (LDR)	107
4.6 Results and Discussion	107
4.7 IWSAN Findings Based on Off the Shelf Hardware	114
4.8 Design and Implementation of Handmade IWSAN	115
4.9 System Realizations of Handmade IWSAN	116
4.9.1 Sensor Node Composition	118
4.9.2 Sensors	121
4.9.3. Coordinator Node Composition	122
4.10. System Features and Applications	125
4.11 Conclusions	127

**CHAPTER FIVE AGRICULTURAL CONTROL SYSTEM BASED  
ON WIRELESS SENSOR NETWORK: POWER  
MANAGEMENT PERSPECTIVE**

5.1 Introduction	129
5.2 Greenhouse Wireless Sensor Actor Network	130
5.3 CSMA/CA OF IEEE802.15.4	132
5.4 IWSAN Power Consumption and Network Lifetime	135
5.4.1 Experimental Computation Results	138
5.4.2 Network Node Lifetime Analysis and Discussion	143
5.5 Dynamic Check-In Interval Model	150
5.5.1 Worth-To-Send Technique (W2S)	151
5.5.2 W2S Modelling and Analysis	154
5.5.3 Proposal: Smart Sensor Hardware Structure Based On W2S Technique	158
5.6 Conclusions	161

**CHAPTER SIX WIRELESS SENSOR NETWORK WAVE  
PROPAGATION IN VEGETATION**

6.1 Introduction	163
6.2 Precision Agriculture Based WSAN	164
6.3 WSAN Channel Communication Characteristics	165
6.3.1 Waves Propagation Approach	166
6.4 Radio Wave Propagation Models in Simulation Tools	167
6.4.1 Free Space Path Loss (FSPL)	169
6.4.2 Two-Ray Ground Reflection Model	170
6.5 Wave Propagation Models in Vegetation	171
6.5.1 Weissberger's Model	172
6.5.2 Early ITU Vegetation Model	173

6.6 Total Path Loss in Vegetation	174
6.7 Simulation Setup of WSAN in Agricultural Greenhouse	175
6.8 Results and Discussion	178
6.8.1 Communication Coverage Simulation	183
6.8.2 Network Connectivity Simulation	186
6.9 Experimental Analysis of Packet Error Rate	189
6.10 Conclusion	191
<b>CHAPTER SEVEN CONCLUSIONS AND FUTURE WORKS</b>	
7.1 Introduction	194
7.2 Development of A Novel Intelligent WSAN	194
7.3 Simulation of Network Connectivity and Performance in Vegetation	195
7.4 Future Works	196

## LIST OF SYMBOLES

$T_F$	Current temperature °C
$T_{set}$	Desired temperature °C
<i>Error</i>	Input linguistic variable
$P_i$	The peak value of $i^{th}$ crisp output fuzzy set.
$\mu(x_i)$	The weighted strengths of each output member function.
<i>C.out</i>	Crisp output.
$T_{in}$	The interior air temperature (°C).
$T_{out}$	The outdoor temperature (°C).
<i>UA</i>	The heat transfer coefficient (W K <sup>-1</sup> ).
<i>V</i>	Volume (m <sup>3</sup> ).
<i>Cp</i>	Specific heat of air.
$q_{heater}$	The heat provided by the greenhouse heater (W).
<i>Si</i>	The intercepted solar radiant energy (W).
<i>Pr</i>	Received signal powers (W) transmitter and $\lambda$ is the
<i>Pt</i>	Transmitted signal power (W).
<i>Gt</i>	Transmitter antennas gain.
<i>Gr</i>	Receiver antennas gain.
<i>D</i>	Distance (m).
$\lambda$	Wavelength (m).
<i>Ploss</i>	Power loss (dB).
<i>ht</i>	Height of transmitter antenna.
<i>hr</i>	Height of receiver antenna.
<i>LPE</i>	Path loss two ray model
<i>r</i>	Fresnel zone radius
<i>Lveg</i>	Excess attenuation due to foliage
<i>df</i>	Depth of a deciduous tree (m)

A	Empirically calculated constants
B	Empirically calculated constants
C	Empirically calculated constants
$L$	Foliage loss (dB)
$P_{Tot-loss}$	Total path loss
$P_{FSPL}$	FSPL (PEMODEL)
$P_{Env-loss}$	vegetation loss
$R_{sensitivity}$	Receiver sensitivity
$LOSS_{thr}$	Maximum path loss (dB)
$d_{max}$	Maximum propagation distance
$N_{con}$	The number of connected nodes with the main node in the
$N_{node}$	The total number of nodes
$I_x$	The instantaneous current in the given state spent
$T_{on}$	The time spent during operation
$T_{off}$	Time spent where no drawing current in the cycle of state
$T_w$	Wake up time taken
$T_R$	Read data from the sensors.
$I_R$	Current drawn through read data from the sensors
$T_{Back}$	Back-off Period
$T_{CCA}$	CCA Period
$I_{Back}$	The current drawn
$I_{CCA}$	the current drawn
$T_{Packet}$	Data Transmission Period
$I_{Packet}$	The radio transmitting current
$I_{Sleep}$	The current drawn during the approximate one minute sleep
$T_{Sleep}$	Sleep period
$I_{av}$	Average current
$I_{phase}$	The current drawn by the node during phase operation
$t_{on}$	The time consumed during a phase of operation.
$Wp$	The total charge during all phases except CSMA/CA and
$Tp$	The total charge of channel sensing and transmission phases.
$Sop$	The W2S software Solution total charge

$P_{Save}$	The saving percentage.
$Total_p$	The total charge of all phases except sensors charge.
$Sen_p$	The total charge consumed by sensors.
$H_{op}$	Hardware solution of total charge
$\beta$	Final fuzzy value
$\alpha_{max}$	Fuzzy firing strength
$P_i$	Crisp output duty cycle
$\mu(x_i)$	The weighted strengths of each output member function
$T_{in}$	The interior air temperature ( $^{\circ}C$ )
$T_{out}$	The outdoor temperature ( $^{\circ}C$ )
$UA$	The heat transfer coefficient ( $W K^{-1}$ )
$V$	The volume ( $m^3$ ),
$C_p$	The specific heat of air ( $1006 JK^{-1} K^{-1}$ )
$S_i$	The intercepted solar radiant energy ( $W$ ),
$q_{fog}$	The water capacity of the fog
$\lambda$	The latent heat of vaporization ( $2257 J/g$ )
$V_R$	The ventilation rate ( $m^3 (air) s^{-1}$ )
$w_{in}$	The interior humidity ratios
$w_{out}$	The exterior humidity ratios
$Q_c$	The size of heating unit required in $Btu/hr$
$U$	heat transfer coefficient in $Btu/hr per ft^2$
$A$	The exposed surface area in square feet
$\Delta T$	The difference between the highest temperature to be
$T_i$	The highest temperature to be maintained in the greenhouse.
$T_o$	The minimum outside night temperature.
$Len$	The length of greenhouse factor.
$H_{out}$	Outside air humidity.
$T_{out}$	Outside temperature
$TinF$	The feedback signal of temperature.
$HinF$	The feedback signal of Humidity.

## Pembangunan Rangkaian Pengesan Pengaksi Tanpa Wayar Pintar Baharu Untuk Aplikasi Agrikulture

### ABSTRAK

Pelaksanaan Rangkaian Pengesan Pengaksi Tanpa Wayar, *Wireless Sensor Actor Network (WSAN)*, yang baik memerlukan skim pemprosesan pintar, penggunaan tenaga yang efektif dan hubungan komunikasi yang boleh dipercayai. Di dalam kajian ini satu pembaharuan tentang Rangkaian Pengesan Pengaksi Tanpa Wayar Pintar, *Intelligent Wireless Sensor Actor Network (IWSAN)*, berasaskan Fuzzy Interference System untuk kawalan iklim di rumah hijau dibentangkan. Dua faktor penting yang memberi kesan terhadap iklim rumah hijau ialah suhu dan kelembapan pada waktu siang dan malam. Penggunaan Fuzzy Interference System serta peralatan yang dibeli dari pasaran dan buatan sendiri digunakan untuk mereka bentuk, simulasi dan melaksanakan IWSAN untuk pengawalan iklim di rumah hijau. Selingan pendaftaran baru yang dinamik, *New Dynamic Check-In Interval technique (DCI)*, direka bentuk dan dibangunkan untuk memanjangkan jangka hayat rangkaian nod pengesan. Penggabungan kecerdasan buatan bersama WSN pelakon menunjukkan ciri-ciri yang unggul berbanding dengan sistem kawalan berwayar tradisional dan pemantauan dan pelaksanaan rangkaian tanpa wayar yang mudah. IWSAN membuktikan bahawa ia mempunyai kecekapan pengawalan tugas yang agak tinggi iaitu dalam lingkungan  $\pm 0.5$  dan  $\pm 1$  dalam penetapan titik, skala, mobiliti dan kos efektif untuk platform buatan tangan dan keupayaan berubah mengikut bidang geografi. Di samping itu, ia juga mempunyai keupayaan memperhalusi keseluruhan sistem untuk tugas-tugas pertanian yang lain. Ia dilaksanakan sebagai perisian tertanam dalam nod pengesantetapi dijalankan sebagai penyelesaian untuk peralatan yang dicadangkan. Pelaksanaan teknik perisian DCI menawarkan 10 hari maksimum dan 367 hari untuk peralatan yang dicadangkan dengan nilai ambang sebanyak 0.5. ISWAN adalah bukan Permulaan bagi topologi rangkaian isyarat dan ia menyediakan jangka hayat selama 1.24 tahun berasaskan tempoh tidur selama 1 minit untuk setiap nod pengesandan ia dijanakan oleh bateri berkuasa 210mAh. Di dalam rumah hijau, ketidakbolehpercayaan kualiti rangkaian of IWSAN boleh menimbulkan kehilangan paket yang tidak menentu yang boleh dianggap sebagai faktor yang patut diberi perhatian dalam mengawal prestasi sistem kawalan. Kebolehpercayaan sistem ISWSAN dalam rumah hijau adalah tinggi dengan kadar kejayaan minimum penghantaran paket sebanyak 85% dan mencapai prestasi yang stabil dalam 1 minggu operasi. Kestabilan prestasi sistem dapat dikurangkan apabila satu atau lebih nod sensor gagal. Isyarat yang kehilangan arah disebabkan oleh tumbuh-tumbuhan di dalam rumah hijau dijadikan model untuk menentukan ketinggian antena, jarak pemisah dan kedalaman rimbunan dedaun, simulasi dengan skim pengagihan grid bersegi dan diprogramkan untuk membantu simulator WSN yang diketahui umum. Jarak pembahagian maksimum untuk komunikasi yang berkesan dalam bidang tumbuh-tumbuhan ditentukan berdasarkan rangkaian MED model tumbuhan yang mana menunjukkan sambungan sempurna 100% adalah daripada kurang 50m dari kedalaman dedaunan tetapi model ITU menunjukkan sambungan tersebut kurang daripada 88%.

## **Development of a Novel Intelligent Wireless Sensor Actor Network For Agricultural Applications**

### **ABSTRACT**

Deployment of a successful wireless sensor actor network requires intelligent processing schemes, effective power consumption and reliable communication links. A novel intelligent wireless sensor-actor network (IWSAN) based on Fuzzy Inference System for agricultural greenhouse climate control is presented in this research. The two most important mutual effects agricultural greenhouse climate parameters are considered which are the temperature and humidity during diurnal and nocturnal time. Design, simulation and implementation of IWSAN for agricultural greenhouse climate control based on Fuzzy Inference System is outlined both for off the shelf and handmade platforms. The integration of artificial intelligence with WSN proves superior features in comparison with traditional wired control systems and simple wireless monitoring and acting network. IWSAN proves high efficiency of controlling task of  $\pm 0.5$  and  $\pm 1$  tolerance of setting points, scalability, mobility and cost effective of handmade platform, beside flexibility of using the system in various geographical areas besides the capability of tuning the whole system for other agricultural tasks. New Dynamic Check-In Interval technique (DCI) is modelled and developed to prolong the lifetime of network sensor nodes. It is implemented as software embedded in sensor nodes while a proposed hardware solution is conducted. The DCI technique of software implementation offers maximum of 10days while 367days for proposed hardware solution with a threshold value of 0.5. IWSAN of non beacon start network topology provides a 1.24 year lifetime for sensor nodes based 1 minute sleep period and powered by 210mAh battery. In agricultural greenhouse, unreliable link quality of IWSAN may raise unpredictable packet loss that is considered as a factor of more noteworthy effect on the performance of the control system. The system reliability of IWSAN in the greenhouse is high with minimum success rate of packet transmission of 85% and achieves settled performance during one week of operation. The unpredictability in the system performance is minimized when one or more sensor nodes are failed. Vegetation path loss in the greenhouse is modelled as a function of antenna heights, separation distance and various foliage depths, simulated with square grid distribution scheme and programmed to assist nowadays well known WSN simulators. The maximum partitioning distance for reliable communication in vegetation field is determined where network connectivity based on MED vegetation model shows perfect connectivity of 100% of foliage depth less than 50m while ITU model exposes less connectivity of about 88%.

## CHAPTER ONE

### TOWARD INTELLIGENT WIRELESS SENSOR ACTOR NETWORKS

#### 1.1 Introduction

Nowadays, the agricultural applications are adopting latest new technologies based on large production and multiplicity requirements, also for quality enhancement and market neediness. Hence, advanced technology engineers are acting a crucial role in the improvement of agricultural management fields such as fusion of automatic control, wireless communication and robotic systems that are integrated almost within diverse levels of agricultural productions like cultivation, environment refinement and control, crop harvest, processing, and transportation. The environmental effects and crop quality are encouraging the substantial demands of automatic control paradigms incorporation within the agricultural application fields. Where the objective of these technologies is to continuous monitoring and control of crop environment and growth that targeting the enhancement of productivity and maintain grower requirements.

In precision agriculture, wireless Sensor Actor Networks (WSANs) used to support in field data collection, precise irrigation process, autonomous fertilizer and remote data gathering and analysis (Wang et al. 2006). In greenhouses growers are able to cultivate plants where the environment would otherwise be unfeasible for budding the plants. Therefore, there is an urgent need for new technologies that assist within environment control yielding of optimizing the growth of plants, enhancing the quality and finally increasing the productivity (Bennis et al., 2008; Wang et al. 2006).
