

**MODELING AND CHARACTERIZATION OF
GRAPHENE FOR EFFICIENT
MILLIMETERWAVE AND TERAHERTZ
ANTENNAS**

By

**MOHAMMED TAIH GATTE
(1340810872)**

A thesis submitted in fulfillment of the requirements for the degree of
Doctor of Philosophy

**School of Computer and Communication Engineering
UNIVERSITI MALAYSIA PERLIS**

2017

UNIVERSITI MALAYSIA PERLIS

DECLARATION OF THESIS

Author's full name : MOHAMMED TAIH GATTE

Date of birth : 1st July 1968

Title : Modeling and Characterization of Graphene for Efficient Milimeterwave and Terahertz Antennas

Academic Session : 2016/2017

I hereby declare that the thesis becomes the property of Universiti Malaysia Perlis (UniMAP) and to be placed at the library of UniMAP. This thesis is classified as:

- CONFIDENTIAL** (Contains confidential information under the Official Secret Act 1972)
- RESTRICTED** (Contains restricted information as specified by the organization where research was done)
- OPEN ACCESS** I agree that my thesis is to be made immediately available as hard copy or on-line open access (full text)

I, the author, give permission to the UniMAP to reproduce this thesis in whole or in part for the purpose of research or academic exchange only (except during a period of _ years, if so requested above).

PERMISSION TO USE

In presenting this thesis in fulfilment of a post graduate degree from the Universiti Malaysia Perlis, I agree that permission for copying of this thesis in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor(s) or, in their absence, by the Dean of the Graduate School. It is understood that any copying or publication or use of this thesis or parts thereof for financial gain shall not allowed

without any written permission. It is also understood that due recognition shall be given to me and to Universiti Malaysia Perlis for any scholarly use which may be made of any material from my thesis

Request for permission to copy or to make other use of material in this thesis whole or in part should be addressed to

**Dean of Graduate School
Universiti Malaysia Perlis (UniMAP)
No. 112 & 114, Tingkat 1, Blok A, Taman Pertiwi Indah,
Jalan Kangar-Alor Setar,
Seriab, 01000 Kangar, Perlis.**

ACKNOWLEDGEMENTS

First and foremost, all praise, thanks and gratitude to Allah (SWT) who gave me the faith, strength, and insistence to complete this project. All purely thanks go to anyone who has contributed to the success of this work. Particularly, I would like to express my sincere gratitude and appreciation to my supervisor, **Dr. Ping Jack Soh**, who is understanding and easily adapted to the work when I met him after my previous supervisor left his job at the university. His continuous guidance, encouraging, valuable discussion and comments enhanced the work intensively and strengthened the scientific research values. I would also like to express my thanks and gratitude to **Prof. Dr. R. Badlishah Ahmad**, my co-supervisor, his suggestions and support during the period of study are valuable, and it helped me a lot particularly in the difficult time. All thanks to the UniMAP staff, especially the School of Computer and Communication staff.

I thank my previous main supervisors, **Dr. Fareq Malek**, he was so kind during the time when I was working with him, and **Dr. Abid Yahya**, who was a short-lived star in the period of my study. I wish them well in their new position and future career.

My special thanks go to **Prof. Dr. Bassim H. Hameed**, for his precious advice and all my friends during my academic period.

Last, but not least, the sincerest gratitude to my family specifically, to my mother, special thanks to my wife and kids to support me in the hard circumstances. Also to my brothers and sisters, their daily prayers gave me the motivation and strength towards my goals, and also to everyone who supported and prayed for me.

Mohammed Taih Gatte

TABLE OF CONTENTS	IV
LIST OF TABLES	VIII
LIST OF FIGURES	XI
LIST OF ABBREVIATIONS	XVII
LIST OF SYMBOLS	XX
ABSTRAK	XXII
ABSTRACT	XXIII
CHAPTER 1: INTRODUCTION	1
1.1 Background	1
1.1.1 The MMW and THz Spectrum	2
1.1.2 Antennas Challenges in MMW and THz	3
1.1.3 Carbon Allotropes Nanomaterials	5
1.1.4 Graphene Specific Properties and Promising Application	6
1.2 Research Motivations	7
1.3 Problem Statement	8
1.4 Objectives	9
1.5 The Contribution of Thesis	10
1.6 Scope of Study	11
1.7 Thesis Organization	12

CHAPTER 2: LITERATURE REVIEW	14
2.1 Introduction	14
2.2 Overview of Microstrip Antennas	15
2.2.1 Microstrip Antennas	16
2.2.2 Features of Microstrip Antenna	18
2.2.3 Microstrip Antenna Feeding Techniques	19
2.2.4 Microstrip Antenna Figure of Merits	20
2.3 Overview of Millimeter Wave and THz Antennas	22
2.3.1 Millimeter Wave Antennas	22
2.3.2 THz Antennas	24
2.4 The Materials of Antenna	25
2.4.1 Conducting Materials	25
2.4.2 Dielectric Materials	28
2.4.3 New Materials for Antennas	29
2.5 Carbon Nanomaterials Overview	30
2.5.1 Graphene in Antenna Applications	31
2.5.2 Graphene Surface Properties	36
2.5.3 The Main Effect Parameters on Graphene Properties	38
2.5.4 Production of Graphene	38
2.5.5 Modeling of Graphene Depositing on Antenna Substrate	40
2.5.6 The Effect of Coating Metal Conductor via Graphene	41
2.5.7 Adhesive of Graphene Coated Metal to The Dielectric Substrate	42
2.6 Summary	44
CHAPTER 3: METHODOLOGY	46
3.1 Introduction	46

3.2	Materials and Methods for MMW and THz Microstrip Antenna Design	47
3.2.1	Geometric Modeling of Microstrip Antennas	48
3.2.2	Microstrip Antennas with Different Patch Shapes	51
3.2.3	Substrate Materials of Microstrip Antennas	52
3.2.4	Conducting Materials of Microstrip Antennas	53
3.2.5	Surface Properties of Graphene	54
3.2.6	Modeling of Graphene Based on Surface Properties	56
3.2.7	Characterization of Graphene Model Based on Surface Properties	57
3.3	Deposition of Graphene on Antenna Substrate	58
3.3.1	Configuration 1 with Different Graphene Models	59
3.3.2	Configuration 2 with Different Doped Graphene as Ground	60
3.3.3	Configuration 3 Different Graphene Doping for Both Conducting Layers	61
3.4	The Effect of Patch Topologies on THz Antenna	62
3.4.1	Behavior of the Doped Graphene-Based Patch Antennas	64
3.5	Coating Antenna Conducting Layers with Graphene	64
3.5.1	Graphene Deposition on the Conducting Layers of Antenna	65
3.6	Adhesion of Graphene Layer on the Antenna Substrate	67
3.7	Frequency Optimization for Graphene-based Antenna Utilization	70
3.7.1	Conductor Losses of Graphene and Copper Based Antennas	73
3.8	The Effect of Graphene on Antenna Figures-of-Merit	74
3.9	Summary	74
CHAPTER 4: RESULTS AND DISCUSSIONS		76
4.1	Introduction	76
4.2	Modeling and characterization of monolayer graphene	77
4.2.1	Surface properties characterization based on chemical potential	77

4.2.2	Graphene surface properties characterization according to temperature	79
4.2.3	Graphene surface properties characterization based on relaxation time	81
4.3	Modeling of the graphene based antenna conducting layers	82
4.3.1	Graphene models as the antenna conducting layers	82
4.3.2	The effect of doped graphene on THz antenna behavior	84
4.3.3	The effect of doped graphene on MMW antenna behavior	89
4.4	Modeling of fabrication techniques for graphene based antenna	93
4.4.1	The Effect of Conducting Layers Coating by Graphene	95
4.4.1.1	The graphene coating effect on power radiated and power loss	98
4.4.1.2	The effect of coating by graphene on S11 and bandwidth	102
4.5	The critical frequency for none doped graphene	102
4.5.1	The CrFr According to Gain and Radiation Efficiency	107
4.5.2	CrFr According to Radiated Power and Metal Loss	117
4.5.3	The CrFr's of Antennas According to Models and Parameters	127
4.6	The Effect of Using Graphene on The Antenna Figures-of-merit	128
4.7	Summary	131
	CHAPTER 5: CONCLUSIONS AND FUTURE WORKS	133
5.1	Conclusions	133
5.2	Future Works	136

Q_d	dielectric losses quality factor
Q_{rad}	radiation (space wave) losses quality factor
Q_{sw}	surface waves loss quality factor
Q_t	Total quality factor
ρ	Resistivity
δ	The substrate material loss tangent
σ	Conductivity
σ_s	Surface Conductivity
Z_s	Surface Impedance
μc	Chemical Potential
q_e	Electron charge
τ	Relaxation Time
δ_s	skin depth
T	Temperature
j	Imaginary Unit
K_B	Boltzman's Constant
\hbar	Reduce Planck Constant

Pemodelan dan Pencirian Graphene untuk Antena Gelombang Milimeter dan TeraHertz Berkecekan Tinggi

ABSTRAK

Pembangunan teknologi gelombang millimeter (MMW) dan Terahertz (THz) untuk sistem penerima tanpa wayar dan aplikasi komunikasi telah berlaku dengan pesat disebabkan ciri-ciri unik gelombang dalam jalur-jalur ini. Antena merupakan salah satu elemen teras dalam aplikasi komunikasi, manakala pembangunan antena berkecekan tinggi dalam jalur-jalur gelombang ini memerlukan penggunaan bahan nanokarbon seperti graphene. Ini adalah disebabkan oleh kemerosotan konduktiviti logam konvensional dengan peningkatan frekuensi. Penyelidikan ini berfokus untuk menambahbaik prestasi antena dalam jalur MMW dan THz dengan menggunakan graphene. Penggunaan graphene memerlukan pemodelan matematik dan pencirian sifat permukaannya yang berubah mengikut frekuensi. Perubahan beza upaya kimia (μc) (menerusi pendopan) menunjukkan kesan yang lebih ketara berbanding parameter yang lain. Perubahan ini adalah bergantung kepada pincangan elektrik, pincangan magnetik atau pendopan kimia. Nilai $\mu c = 0\text{eV}$ digunakan dalam model graphene yang tidak terdop (ND-G), manakala nilai-nilai $\mu c = 0.25\text{eV}$ and $\mu c = 0.5\text{eV}$ diguna dalam model graphene yang didop (D-G). D-G didapati menunjukkan nilai konduktiviti permukaan yang lebih tinggi berbanding ND-G, manakala peningkatan μc menyebabkan peningkatan konduktiviti graphene. Model graphene (D-G dan ND-G) kemudiannya diintegrasikan ke atas substrat dan dimasukkan ke dalam perisian penyelesaian mikro gelombang CST sebelum disimulasikan untuk menentukan prestasi antena berasaskan graphene (GBA) ini. Model-model GBA ini turut menunjukkan penambahbaikan prestasi yang signifikan berbanding model-model berasaskan tembaga (1 THz, 1.29 THz, dan 1.49 THz). Walaubagaimanapun, penggunaan ND-G tidak selalunya menunjukkan peningkatan prestasi yang ketara pada frekuensi MMW (64GHz), tetapi peningkatan prestasi ini lebih tertumpu kepada jalur operasi yang lebih tinggi. Dua teknik lain (salutan dan lekatan) dicadangkan sebagai kaedah fabrikasi alternatif bagi antena-antena berasaskan graphene. Teknik-teknik ini menunjukkan penambahbaikan prestasi yang sama berbanding dengan teknik pemendapan terus dalam jalur-jalur MMW (70GHz) dan THz (1.71 THz). Kajian ini turut menunjukkan bahawa model antena menggunakan teknik lekatan menunjukkan prestasi yang lebih baik berbanding teknik pemendapan terus pada frekuensi MMW. Seterusnya, suatu kajian untuk menentukan frekuensi kritikal (CrFr) bagi penggunaan ND-G dan tembaga pada frekuensi MMW dan THz telah dijalankan (30GHz-3THz). Kajian ini mempertimbangkan topologi dan parameter prestasi ND-G-GBA untuk menentukan CrFr. Keluk-keluk parameter prestasi diplotkan melawan frekuensi untuk memudahkan perbandingan di antara pelbagai konfigurasi GBA. CrFr ditunjukkan pada titik-titik persilangan di antara keluk-keluk parameter prestasi bagi antena berasaskan tembaga dan antena berasaskan graphene. Kajian ini turut dilanjutkan untuk GBA di mana graphene digunakan sama ada sebagai bumi atau pemancar sahaja. Perbandingan topologi, konfigurasi dan parameter antena yang berbeza menunjukkan CrFr yang berbeza, di antara 0.130 – 0.240 THz, dengan purata 0.147 THz. Manakala bagi konfigurasi antena yang menggunakan graphene sahaja sebagai bumi atau pemancar, frekuensi kritikal didapati berada di antara 0.145 – 0.365 THz, dengan purata 0.213 THz. Ini menunjukkan bahawa CrFr untuk ND-GBA adalah bergantung kepada topologi antena serta konfigurasinya.

Modeling and Characterization of Graphene for Efficient Millimeterwave and THz Antennas

ABSTRACT

The development of millimeterwave (MMW) and Terahertz (THz) technologies for a wide range of wireless sensing and communication applications have been rapid due to the unique characteristics of waves in these bands. Antennas are regarded as the core of wireless applications, and its development for efficient operation within these bands require the use of new carbon nanomaterials such as graphene. This is due to the conductivity deterioration of conventional metals with increasing frequency. This work focuses on improving the antenna performance parameters in the MMW and THz bands based on the utilization of graphene. The employment of graphene requires mathematical modelling and characterization of its surface impedance, which are frequency dependent. The chemical potential (μc) (doping) indicated a more significant effect compared to other variables. Its values are influenced by electrical bias, magnetic bias, or chemical doping. The $\mu c = 0\text{eV}$ value is used as the non-doped graphene (ND-G) model, while ($\mu c = 0.25\text{eV}$ and $\mu c = 0.5\text{eV}$) values are used for the doped graphene (D-G) models. D-Gs were found to exhibit higher surface conductivities than ND-G, while the increasing μc resulted in increased graphene conductivity. The material models of graphene (D-G and ND-G) are then integrated onto the substrate and the microwave solver software CST prior to simulations to determine the graphene based antenna (GBA) performance. These GBA antenna models indicated significant performance improvement at THz frequencies (1 THz, 1.29 THz, and 1.49 THz) compared to the copper-based antenna models. On the contrary, the use of ND-G does not always show such significant improvements at MMW frequencies (64GHz), but is rather more concentrated on the bands beyond it. Two other new techniques (coating and adhesives) are proposed as alternative fabrication methods of graphene based antennas. These techniques indicated similar parameter improvements to that of the direct deposition technique in the MMW (70GHz) and THz (1.71 THz) bands. It was also discovered that antenna modeling using the adhesive technique performs better than the direct deposition technique at MMW frequencies. Next, an investigation to determine the critical frequency (CrFr) for the use of ND-G and copper at MMW and THz spectrum (30GHz-3THz) was performed. This study considers different topologies and performance parameters of ND-GBA to determine CrFr. The curves of the performance parameters are plotted against frequency to facilitate comparison between various GBA configurations. The CrFr is determined using the intersections of the performance curves for copper-based and graphene-based antenna. The investigation is also extended onto GBAs with graphene as ground or patch only. The comparison for different antenna topologies, configurations, and parameters reported different CrFr, ranging from 0.130 - 0.240 THz, with an average of 0.147 THz. On the other hand, the critical frequencies for the patch and ground only graphene-based configurations ranged between 0.145 - 0.365 THz, with an average of 0.213 THz indicating that the CrFr of ND-GBA depends on the antenna topologies and configurations.

CHAPTER 1

INTRODUCTION

1.1 Background

Antennas are cohesively related to wireless communications and wireless sensing networks (WSN). Beside wireless communications, antennas are also crucial towards other applications such as imaging, spectroscopy, sensing, detection, and energy harvesting, particularly in frequency spectrums higher than microwaves (MW) band such as millimeter wave (MMW) terahertz (THz) and infrared (IR). Figure 1.1 shows the architecture of typical wireless sensor nodes and the significance of efficient antenna to more than one unit in the node.
